技术参数

- 工作环境
 - 泵的最高环境温度+40℃, 超过+40℃以上的环境, 或者工作电机在海拔1000米以上, 电机输出功率会降低, 如下图所示, 这种情况请选择更大输出功率的电机。

例: 上述泵在最高安装海拔3000米以上时, 电机功率降低到80% (在环境温度达70°C时, 电机功率降低到70%)。

2. 转速

输出液体的密度或运动粘度大于水会导致泵的压力、水力性能显著改变, 功率消耗上升, 在这种情况下, 必须配备更大的功率电机。

 - Low-noise motors
 - Motors with thermal protection
- Motors of the exported stainless steel multi-stage pumps may be configured as required by customers.

Technical parameters

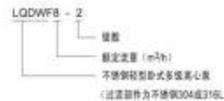

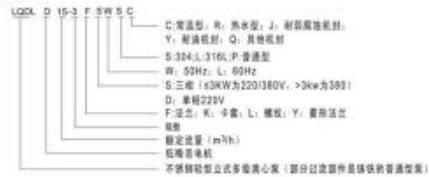

1. Operating environment
The highest operating temperature of the pumps is +40°C. If the pumps are used at a temperature above +40°C, or their motors are installed at an altitude higher than 1000m, the output power of the motors will drop. See the figure below. In this circumstance, motors with larger output power are needed.

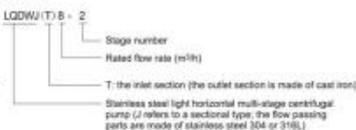

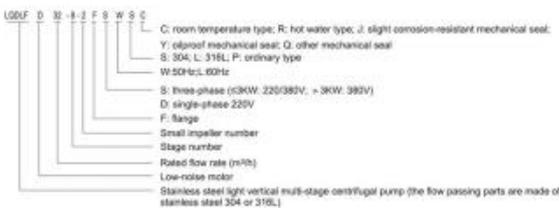

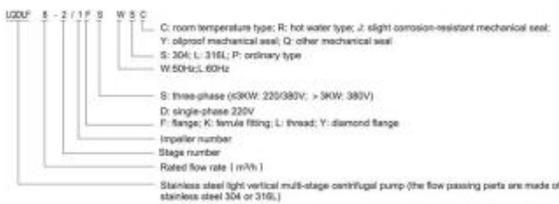

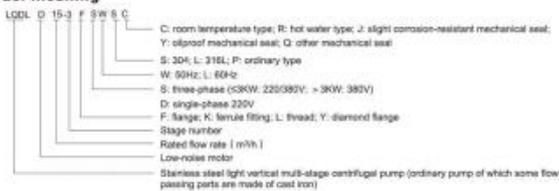

For example, according to the figure above, the motor power P₂ will drop to 84 percent when the pump is installed at an altitude higher than 3000m, or to 78 percent when the ambient temperature is 70°C.

2. Viscosity
If the densities or kinematic viscosities of the output by the liquids are larger than that of water, pressure and hydraulic performance of the pumps will change greatly and the power consumptions of them will increase. In this circumstance, motors with larger power are needed.

最大入口压力, 请参考表1
Maximum inlet pressure (see Table 1)

泵为最大允许入口压力, 然而, 实际入口压力+液流时的压力必须始终低于最大允许工作压力, 如果超过最大允许工作压力, 电机中的轴承可能损坏, 轴衬的寿命会缩短, 运行和进口压力限制。
Table 1 gives the permissible maximum inlet pressure; however, sum of the actual inlet pressure and the valve-closing pressure must always be smaller than the permissible maximum operating pressure. If the sum is larger than the permissible maximum operating pressure of the pump, the bearing in the motor will possibly get damaged and the shaft seal will have a shorter life. Moreover, there are some examples about the operating pressure and the inlet pressure.

例1(Example 1):
泵型选择为LQDLF-8
最大运行压力: 16bar
最大进口压力: 10bar
出口阀关闭压力为8.7bar下启动运行, 其进口压力必须小于16bar-7.7bar
Pump type: LQDLF-8
Maximum operating pressure: 16bar
Maximum inlet pressure: 10bar
If the pump is started at an outlet valve-closing pressure of 8.7bar, the inlet pressure must be smaller than 7.3bar (the difference of 16bar and 8.7bar).

例2(Example 2):
泵型选择为LQDLF-2
最大运行压力: 16bar
最大进口压力: 10bar
出口阀关闭压力为2.0bar, 泵允许在进口压力为6.0bar下启动运行, 因为其出口阀关闭压力仅为2.0bar, 其实际产生的液流压力为6.0+2.0=8.0bar, 不超过最大运行压力。
Pump type: LQDLF-2
Maximum operating pressure: 16bar
Maximum inlet pressure: 10bar
In the case of an outlet valve-closing pressure of 2.0bar, the pump is allowed to be started at an inlet pressure of 6.0bar. The outlet valve-closing pressure is 2.0bar only and the actual motion pressure of the pump will be 8.0bar (sum of 6.0bar and 2.0bar) that is not larger than the permissible maximum operating pressure.

下图表示压力和温度的界限。压力和温度请在所示范围内。
The figure below gives limits of pressure and temperature.
The actual pressure and temperature must be within the ranges.

最小入口压力的计算。如图2所示:
Calculation of the minimum inlet pressure (see Fig.2)

最小入口压力P₁ (单位:米水柱) 计算公式: $H = P_b \times 10.2 - NPSH - H_f - H_v$
 P_b = 当地大气压 (标准大气压为 1bar) (封闭系统中由液面指示的系统压力 (单位:米水柱))
 $NPSH$ = 汽蚀余量 (单位:m) (可从样本中查得NPSH性能曲线中读取)
 H_f = 吸入管道中的摩擦损失 (单位:m)
 H_v = 液体的汽化压力 (单位:m) (见附表3)
 H_s = 安全余量 (最小0.5m)
 如果计算出的H值为正值,表示泵可以吸取高度为H的液体。如为负值,则表示泵汽蚀,必须有一最小进口压力为H的头。

Calculation formula of the minimum inlet pressure H (unit: mH₂O): $H = P_b \times 10.2 - NPSH - H_f - H_v$
 P_b : the local atmospheric pressure (bar) (the standard atmospheric pressure is 1bar) (in a sealed pressure, P_b refers to the system pressure) (unit: bar)
 $NPSH$: net positive suction head (unit: m) (it may be obtained from the NPSH performance curve of the sample pump)
 H_f : wear loss in the pipe at the suction position (unit: m)
 H_v : gasification pressure of the liquid (unit: m) (see Table 3)
 H_s : safety margin (minimum: 0.5m)
 If the obtained H value is positive, it means that the pump is capable of absorbing a liquid to a height of H; if it is negative, it means that the pump will have cavitation and there must be a head with a minimum inlet pressure of H.

最小流量 (Minimum flow rate)

由于有过热危险,泵不在工作流量最小流量状态下。以下曲线表示在相应温度下,最小流量占正常流量的百分比。
There is an overheating risk, so the pump should not run with the minimum flow rate. The curve below shows the percentages of the minimum flow rate in the normal flow rate at the corresponding temperature.

注意:泵运转时必须打开发出阀
Note: the outlet valve must be opened when the pump is running.

性能曲线

下列说明适用于图中所示的曲线:

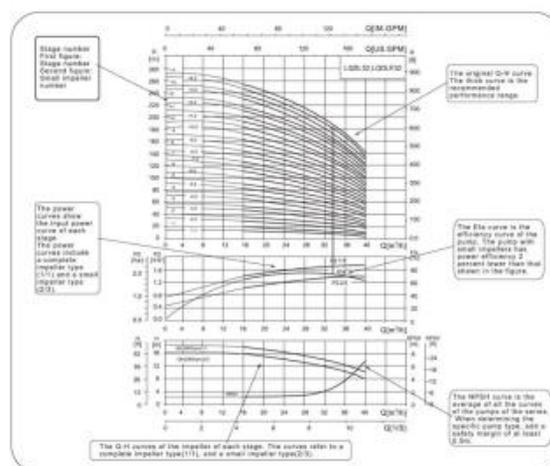

- 所有曲线都基于电机在转速 2900rpm或2950rpm的测量值
- 曲线符合ISO9005
- 测试采用20°C不含空气的水, 运行粘度为1mm²/s
- 泵的使用参照加粗曲线的性能范围, 以防流量过小产生过热和流量过大电机过载等。

泵型选择

- 泵的安装方式
- 泵的额定工作点 (在性能范围上定点)
- 泵输送的液体
- 泵连接尺寸
- 轴封

选型数据

- 在确定规格时必须考虑下述因素:
- 出水点所需的流量和压力
 - 高度差产生的压力损失
 - 管路阻力损失
 - 估计的额定工作点下的最高效率
 - 考虑NPSH值

Performance curve

The instructions below are applicable to the subsequent curves.

- All the curves are based on the values measured at a constant speed of 2900rpm or 2950rpm of the motor.
- The curve tolerances comply with requirements of the ISO9005.
- The tests are done for water with a temperature of 20°C and a kinematic viscosity of 1mm²/s and without air.
- Please refer to the performance ranges of the thick curves for pump operation, so as to avoid overheating because of a too small flow rate and motor overload because of a too large flow rate, etc.

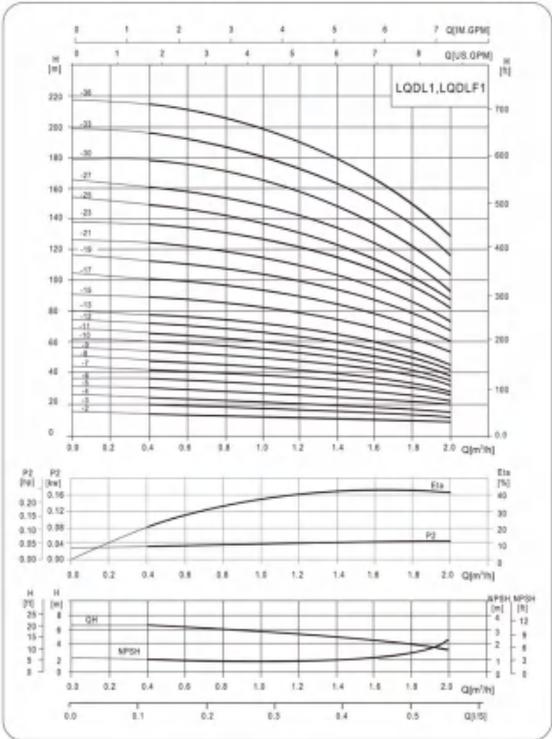

Pump type selection

- Pump installation method
- Rated operating point of the pump (determined on the performance ranges)
- Liquid conveyed by the pump
- Connecting dimensions of the pump
- Shaft seal

Type selection data

- When the specifications are determined, the following factors must be considered:
- The flow rate and pressure necessary for the water outlet
 - The pressure loss because of the altitude difference
 - Pipeline resistance loss
 - Estimated highest efficiency under the rated operating point
 - NPSH
